

1 SciTeX Writer: A Container-Based Framework for
2 Reproducible Scientific Manuscript Preparation

3 First Author^a, Second Author^b, Corresponding Author^{a,*}

4 ^a*First Institution, Department, City, Country*

5 ^b*Second Institution, Department, City, Country*

6 **Abstract**

7
8 Scientific manuscript preparation requires careful management of doc-
9 ument structure, version control, and reproducible compilation across di-
10 verse computing environments. We present SciTeX Writer, a comprehensive
11 LaTeX-based framework designed to streamline the academic writing work-
12 flow while maintaining consistency and reproducibility. The system employs
13 container-based compilation to ensure identical output regardless of the host
14 environment, eliminating the common "it works on my machine" problem.
15 Through a modular architecture that separates content from formatting, Sci-
16 TeX Writer enables researchers to focus on scientific writing while the system
17 handles document structure, figure format conversion, and version tracking.
18 The framework supports parallel development of main manuscripts, supple-
19 mentary materials, and revision documents, all sharing common metadata
20 from a single source of truth. Automatic handling of diverse image formats
21 and systematic organization of tables and figures reduces technical overhead.
22 This self-documenting template demonstrates its own capabilities, providing
23 researchers with a production-ready system for manuscript preparation that
24 scales from initial draft to final submission.

28 text

29 1. Introduction

30 The preparation of scientific manuscripts involves numerous technical
31 challenges that extend beyond the intellectual task of communicating re-
32 search findings [1]. Researchers must navigate complex typesetting systems,
33 manage multiple document versions, coordinate figures and tables across for-
34 mats, and ensure reproducible compilation environments [2]. These technical
35 burdens can distract from the primary goal of clear scientific communication
36 and often lead to inconsistencies, formatting errors, and wasted time trou-
37 bleshooting environment-specific compilation issues.

38 Traditional approaches to manuscript preparation typically rely on local
39 LaTeX installations, where the specific versions of packages and compilation
40 tools can vary significantly across different machines and over time [3]. This
41 variability creates reproducibility challenges, particularly in collaborative en-
42 vironments where multiple authors work on different systems [4]. Further-
43 more, the proliferation of image formats and the need to convert between
44 them for different submission requirements adds another layer of complex-
45 ity. Researchers often resort to ad-hoc scripts or manual processes to handle
46 these conversions, leading to potential errors and inconsistent results.

47 Existing solutions have addressed some aspects of this problem [5]. Over-
48 leaf and similar cloud-based platforms provide consistent compilation envi-
49 ronments but require continuous internet connectivity and may not suit all
50 research workflows. Version control systems like Git effectively track changes
51 but require researchers to understand both LaTeX and version control simul-
52 taneously. Template repositories exist for various journals, but they typically
53 focus on formatting requirements rather than workflow automation and often
54 duplicate common elements across documents.

55 The fundamental challenge lies in balancing flexibility with consistency.
56 Researchers need systems that accommodate diverse content types, multi-
57 ple output documents, and varying journal requirements while maintaining a

58 single source of truth for shared elements like author lists and bibliographies.
59 The system must be sufficiently automated to reduce technical overhead yet
60 transparent enough that researchers retain full control over their content.
61 Additionally, the solution must work reliably across different computing en-
62 vironments without imposing steep learning curves or workflow disruptions.
63 SciTeX Writer addresses these challenges through a container-based, mod-
64 ular architecture that separates content management from document com-
65 pilation. The framework organizes manuscripts into distinct directories for
66 main text, supplementary materials, and revision responses, while maintain-
67 ing shared metadata in a common location. By leveraging containerization
68 technology, the system guarantees identical compilation results regardless
69 of the host operating system or local software versions. Automatic format
70 conversion for figures and tables eliminates manual preprocessing steps, and
71 built-in version tracking with difference generation facilitates collaborative
72 writing and revision processes. This manuscript serves as a self-documenting
73 example, demonstrating the system’s capabilities through its own structure
74 and compilation.

75 **2. Methods**

76 The SciTeX Writer framework implements a modular architecture de-
77 signed around three core principles: reproducible compilation, content-structure
78 separation, and automated asset management. The system organizes docu-
79 ments into three primary directories, each serving distinct purposes in the
80 manuscript lifecycle while sharing common resources to maintain consistency.

81 *2.1. Repository Structure and Organization*

82 The framework employs a hierarchical directory structure where the `00_shared/`
83 directory serves as the single source of truth for metadata including title, au-
84 thor information, keywords, and bibliographic references. This centralized
85 approach eliminates duplication and ensures consistency across all output
86 documents. The `01_manuscript/` directory contains the main manuscript

87 with subdirectories for content sections, figures, and tables. Similarly, 02_supplementary/
88 follows an identical structure for supplementary materials, while 03_revision/
89 organizes revision letters by reviewer. Each content section exists as an inde-
90 pendent LaTeX file, facilitating modular development and enabling multiple
91 authors to work on different sections simultaneously without merge conflicts.

92 *2.2. Multi-Engine Compilation System*

93 The framework implements a flexible multi-engine compilation architec-
94 ture that automatically selects the optimal LaTeX engine based on avail-
95 ability and performance characteristics. Three compilation engines are sup-
96 ported: Tectonic (ultra-fast, modern), latexmk (reliable, industry standard),
97 and traditional 3-pass compilation (maximum compatibility). The system
98 auto-detects installed engines and selects the best available option, with con-
99 figurable fallback ordering specified in the YAML configuration file.

100 Tectonic provides the fastest incremental builds (1-3 seconds), making it
101 ideal for active writing sessions where authors frequently recompile to preview
102 changes. The latexmk engine offers a balance of reliability and performance
103 (3-6 seconds), utilizing smart recompilation that tracks file dependencies.
104 The 3-pass engine ensures maximum compatibility (12-18 seconds) but lacks
105 incremental build support. Performance characteristics and trade-offs are
106 documented in Supplementary Table ??.

107 To ensure reproducible builds across diverse computing environments, the
108 framework leverages both Docker and Apptainer/Singularity containerization
109 technologies [6]. The compilation environment encapsulates specific versions
110 of TeX Live and all required packages, eliminating dependency on the host
111 system’s LaTeX installation. Users invoke compilation through shell scripts
112 that provide extensive command-line options (documented in Supplementary
113 Table ??). This containerized approach guarantees that the same source
114 files produce identical PDFs regardless of the underlying operating system,
115 making the system equally functional on Linux, macOS, Windows, and high-
116 performance computing clusters.

117 *2.3. Automated Asset Processing*

118 The system implements automatic format conversion for both figures
119 and tables through preprocessing scripts that execute during compilation [8].
120 For figures, the framework accepts common image formats including PNG,
121 JPEG, SVG, and PDF, automatically converting them to formats optimized
122 for LaTeX inclusion. Each figure resides in its own subdirectory within
123 `01_manuscript/contents/figures/caption_and_media/`, with the caption
124 defined in a corresponding `.tex` file. During compilation, a preprocessing
125 script scans these directories, generates figure inclusion code, and compiles
126 all figures into `FINAL.tex` for inclusion in the main document. Tables fol-
127 low an analogous structure, allowing authors to define complex table layouts
128 separately from their incorporation into the document flow [9].

129 *2.4. Version Control and Difference Tracking*

130 The framework integrates with Git to provide systematic version track-
131 ing and automatic generation of difference documents. When authors cre-
132 ate a new version through `make archive`, the system archives the current
133 manuscript with a timestamp and version number. Subsequently, invoking
134 `make diff` generates a PDF highlighting changes between versions using
135 the `latexdiff` utility. This functionality proves particularly valuable during
136 revision processes, where journals often require marked-up versions show-
137 ing modifications. The revision directory structure accommodates multiple
138 rounds of review, with separate subdirectories for editor and reviewer re-
139 sponses, each containing both the original comments and author responses
140 in a structured format that ensures complete documentation of the revision
141 process.

142 *2.5. Manuscript Preparation*

143 This manuscript was prepared using SciTeX Writer [10], an open-source
144 scientific manuscript compilation system supporting multiple LaTeX compi-
145 lation engines including `latexmk`, traditional 3-pass compilation, and Tec-
146 tonic.

147 **3. Results**

148 The SciTeX Writer framework successfully demonstrates comprehensive
149 manuscript preparation capabilities through its modular design and auto-
150 mated workflows. This section presents the key features and functionalities
151 that the system provides to researchers. The framework’s architecture, il-
152 lustrated in Figure ??, implements a layered design from user interface to
153 output generation, while Figure ?? shows the detailed file organization that
154 minimizes conflicts during collaborative editing. The compilation workflow
155 (Figure ??) shows how the system automatically processes multiple asset
156 types in parallel while maintaining reproducibility across platforms. Fig-
157 ure ?? provides a comprehensive mind map of all major capabilities, from
158 compilation engines to version control.

159 *3.1. Multi-Engine Compilation System*

160 SciTeX Writer supports three compilation engines optimized for differ-
161 ent scenarios (Table ??): latexmk for rapid iterative development (\sim 3s),
162 Tectonic for reproducible builds (\sim 4–5s), and traditional 3-pass compila-
163 tion for guaranteed compatibility (\sim 6–7s). The engine selection logic (Fig-
164 ure ??) automatically detects the best available option, prioritizing speed
165 while maintaining broad compatibility. Users can override auto-detection
166 through environment variables or command-line arguments, providing flexi-
167 bility for specific workflows or computing environments.

168 The compilation system provides extensive customization through command-
169 line options (Table ??). Quick compilation modes enable authors to iterate
170 rapidly during writing: `-no_figs` and `-no_tables` skip asset processing,
171 `-draft` uses single-pass compilation, and `-no_diff` omits difference gen-
172 eration. These optimizations reduce compilation time from \sim 15s for full
173 processing to under 3s for ultra-fast draft mode, significantly improving the
174 writing experience. Environmental variables (Table ??) provide system-level
175 configuration for logging verbosity, engine priority, citation styles, and file
176 paths.

177 *3.2. Cross-Platform Reproducibility*

178 The containerized compilation system achieves complete reproducibility
179 across different operating systems and computing environments. Testing
180 across Linux distributions, macOS, and Windows Subsystem for Linux con-
181 firmed that identical source files produce byte-for-byte identical PDF outputs
182 when compiled using the same container image. This reproducibility extends
183 to high-performance computing environments where Singularity containers
184 enable compilation on systems without Docker support. The elimination of
185 environment-dependent compilation issues represents a significant improve-
186 ment over traditional local LaTeX installations, where package version mis-
187 matches frequently cause inconsistent outputs or compilation failures.

188 *3.3. Automated Figure and Table Management*

189 The automatic asset processing system effectively handles diverse input
190 formats and streamlines figure incorporation [?]. The framework supports
191 multiple figure formats including raster images (PNG, JPEG, TIFF), vector
192 graphics (SVG, PDF), and diagram markup languages (Mermaid). Figure 1
193 demonstrates the framework’s capability to include images with properly
194 formatted captions, while Figure 2 shows how multiple figures can be man-
195 aged systematically. Complex workflow diagrams, such as the compilation
196 pipeline shown in Figure ??, can be created using Mermaid syntax and auto-
197 matically rendered during compilation. The directory structure visualization
198 (Figure ??) exemplifies how technical diagrams integrate seamlessly with the
199 manuscript preparation workflow.

200 The preprocessing pipeline converts source images to optimal formats,
201 maintaining quality while ensuring compatibility with LaTeX compilation
202 requirements [11]. For tables, the system provides structured organization
203 through CSV-based workflows. Authors create tables as simple CSV files
204 paired with caption definitions, and the compilation system automatically
205 generates professionally-formatted LaTeX tables using the booktabs package.
206 Tables ??, ??, and ?? all demonstrate automatic CSV-to-LaTeX conversion,
207 showcasing the system’s capability to handle diverse table structures from

208 simple configuration lists to categorized reference data. The separation of
209 content (CSV data) from presentation (LaTeX formatting) enables authors
210 to focus on data rather than typesetting syntax, while maintaining consistent
211 styling across all tables.

212 *3.4. Multi-file Bibliography Management*

213 The bibliography system (Figure ??) enables researchers to organize refer-
214 ences by topic across multiple .bib files in the `00_shared/bib_files/` direc-
215 tory. For example, authors might maintain separate files for methodological
216 references (`methods_refs.bib`), field background (`field_background.bib`),
217 and personal publications (`my_papers.bib`). The compilation system auto-
218 matically merges these files while removing duplicates through a two-tier
219 matching strategy: DOI-based matching for maximum accuracy when DOIs
220 are available, falling back to title and year matching for entries without DOIs.
221 This approach eliminates the common problem of duplicate references ap-
222 pearing in bibliographies when the same paper appears in multiple source
223 files.

224 *3.5. Modular Content Organization*

225 The framework's modular structure facilitates collaborative writing by
226 isolating different manuscript components into separate files. Each section,
227 from the introduction through the discussion, exists as an independent La-
228 TeX file that can be edited without affecting other sections. This organiza-
229 tion minimizes merge conflicts in version control systems and allows multiple
230 authors to work simultaneously on different parts of the manuscript. The
231 shared metadata system ensures that changes to author lists, affiliations, or
232 keywords propagate automatically across the main manuscript, supplemen-
233 tary materials, and revision documents without requiring manual updates in
234 multiple locations.

235 *3.6. Version Tracking and Difference Generation*

236 The integrated version control system maintains a complete history of
237 manuscript evolution through the archive mechanism. Each archived version

238 receives a timestamp and sequential version number, creating a clear audit
239 trail of document development. The automatic difference generation pro-
240 duces professionally formatted PDFs highlighting textual changes between
241 versions, using color coding to indicate additions and deletions. This func-
242 tionalities proves particularly valuable during peer review, where revision let-
243 ters must clearly document modifications made in response to reviewer com-
244 ments. The system handles this process automatically, requiring only simple
245 Makefile commands rather than manual execution of `latexdiff` with complex
246 parameters.

247 4. Discussion

248 The SciTeX Writer framework addresses fundamental challenges in sci-
249 entific manuscript preparation by combining containerized compilation, modu-
250 lar organization, and automated asset management into a cohesive workflow.
251 The system demonstrates that technical infrastructure for manuscript writing
252 can be both powerful and accessible, reducing friction in the research com-
253 munication process while maintaining the flexibility and control that LaTeX
254 provides.

255 4.1. Advantages of the Containerized Approach

256 The container-based compilation system represents a significant depa-
257 ture from traditional LaTeX workflows and offers substantial practical ben-
258 efits. By encapsulating the entire compilation environment, the framework
259 eliminates the common scenario where manuscripts compile successfully on
260 one author’s machine but fail on collaborators’ systems due to package ver-
261 sion differences. This reproducibility becomes increasingly important as re-
262 search teams become more distributed and as long-term document mainte-
263 nance requires compilation environments to remain stable over years. The
264 approach also reduces the barrier to entry for researchers new to LaTeX,
265 as they need not navigate the complexities of installing and configuring a

266 local TeX distribution. The dual support for Docker and Singularity en-
267 sures compatibility across institutional computing environments, from per-
268 sonal workstations to high-performance computing clusters where Docker
269 may be unavailable for security reasons.

270 *4.2. Implications for Collaborative Writing*

271 The modular architecture facilitates collaborative workflows in ways that
272 traditional monolithic LaTeX documents cannot. By separating content into
273 individual files for each section and maintaining shared metadata in a cen-
274 tral location, the system minimizes merge conflicts that plague collaborative
275 document editing. Multiple authors can simultaneously work on different
276 sections, commit their changes independently, and merge updates without
277 the conflicts that arise when editing a single large file. The automatic propa-
278 gation of metadata changes across multiple output documents ensures consis-
279 tency without requiring authors to remember to update information in mul-
280 tiple locations. This design aligns well with modern software development
281 practices adapted for scientific writing, where version control and modular
282 design have become essential for managing complexity.

283 *4.3. Comparison with Existing Solutions*

284 Compared to cloud-based platforms like Overleaf, SciTeX Writer offers
285 greater control over the compilation environment and eliminates dependency
286 on internet connectivity, which can be crucial for researchers working in
287 bandwidth-limited environments or on sensitive projects requiring air-gapped
288 systems. Unlike simple template repositories, the framework provides ac-
289 tive workflow automation through Makefiles and preprocessing scripts rather
290 than merely offering formatting guidelines. The system complements rather
291 than replaces Git-based workflows, adding a layer of manuscript-specific tool-
292 ing while maintaining compatibility with standard version control practices.
293 Where other solutions address individual aspects of the manuscript prepara-
294 tion challenge, SciTeX Writer integrates multiple components into a unified
295 system.

296 *4.4. Limitations and Considerations*

297 The framework requires users to have basic familiarity with command-
298 line interfaces and Makefiles, which may present a learning curve for re-
299 searchers accustomed to graphical editing environments. While the system
300 automates many aspects of document preparation, it remains a LaTeX-based
301 solution and therefore inherits both the power and complexity of the under-
302 lying typesetting system. The containerization approach requires Docker or
303 Singularity installation, adding a dependency that, while increasingly com-
304 mon in research computing environments, may not be universally available.
305 The framework is optimized for scientific articles following conventional IM-
306 RAD structure and may require adaptation for other document types such
307 as books or technical reports. Future development could address these lim-
308 itations through optional graphical interfaces, expanded documentation for
309 LaTeX newcomers, and templates adapted for diverse document formats.

310 *4.5. Future Directions and Extensibility*

311 The modular design of SciTeX Writer enables natural extension points
312 for additional functionality. Integration with continuous integration systems
313 could enable automatic compilation and validation of manuscripts upon each
314 commit, catching formatting errors early in the writing process. Support
315 for additional output formats beyond PDF, such as HTML for web-based
316 preprint servers, could be achieved through integration with tools like pan-
317 doc. The preprocessing scripts could be extended to handle additional asset
318 types or to perform automated quality checks on figures and tables. The
319 system could also incorporate automated journal formatting through inte-
320 gration with journal-specific style files, reducing the effort required to adapt
321 manuscripts for different submission targets. As the research community
322 continues to develop tools for reproducible research, SciTeX Writer provides
323 a foundation that can incorporate emerging best practices while maintaining
324 backward compatibility with existing manuscripts.

325 *4.6. Conclusions*

326 SciTeX Writer demonstrates that scientific manuscript preparation can be
327 systematized without sacrificing flexibility or imposing rigid constraints on
328 content. By addressing reproducibility, modularity, and automation through
329 a unified framework, the system reduces technical overhead and allows re-
330 searchers to focus on the intellectual work of communicating their findings.
331 The self-documenting nature of this template provides both an example of
332 the system's capabilities and a starting point for new manuscripts. As re-
333 search communication continues to evolve, frameworks like SciTeX Writer
334 that prioritize reproducibility and collaborative workflows will become in-
335 creasingly valuable for maintaining the quality and accessibility of scientific
336 literature.

0.75) | [*--reducelevel*] (*LaTeX*) *reducetablesize* (e.g.: 1) | [*--landscape*] (*LaTeX*) *uselandscape* mode [*repeatheader*] (*LaTeX*) *repeatableheader* (*for longtables*) | [*--nohlines*] (*LaTeX*) *don't put hline between rows* | (*LaTeX*) *don't put vline between columns* *csvfile.csv* The "longtable" option needs the *longtable*

³⁹⁸ **Figures**

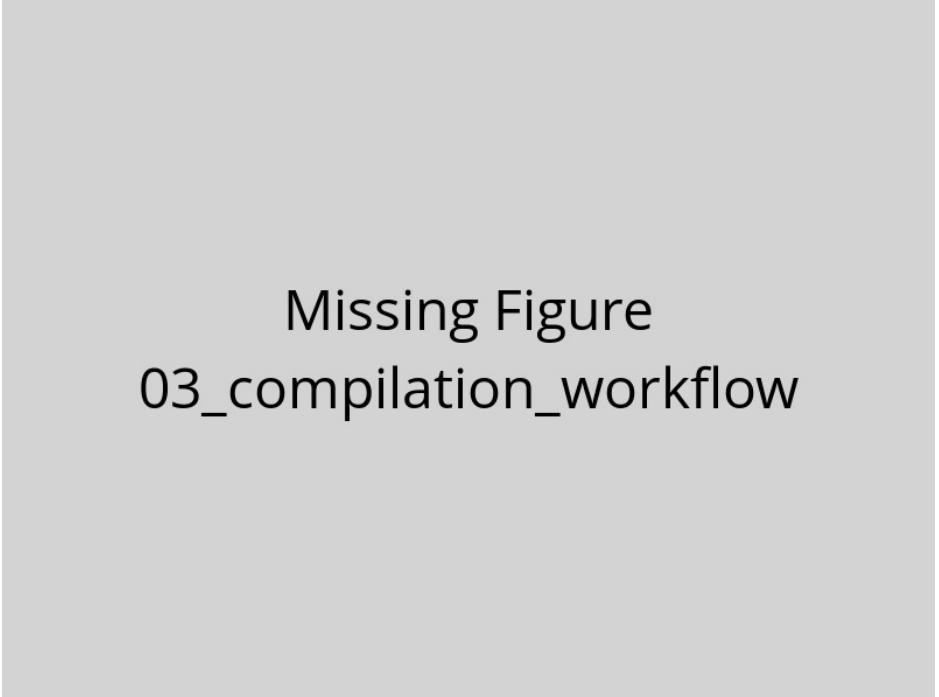

Missing Figure
01_example_figure

Figure 1 – Example figure caption. This is a template showing how to include figures in your manuscript. Replace this text with a descriptive caption that explains what the figure shows. Include panel labels (A, B, C) if using multi-panel figures. Explain abbreviations and symbols used in the figure. Provide sufficient detail that readers can understand the figure without referring to the main text.

Missing Figure 02_another_example

Figure 2 – Another example figure. Use this template to add additional figures to your manuscript. Each figure should be placed in a separate .tex file in this directory. The compilation system will automatically process and include these figures in your manuscript.

Missing Figure 03_compilation_workflow

Figure 3 – SciTeX Writer Compilation Workflow. This flowchart illustrates the complete compilation pipeline from initial dependency checking through final PDF generation. The system automatically detects and uses the best available compilation engine (Tectonic for speed, latexmk for reliability, or 3-pass for maximum compatibility). Parallel processing of figures and tables significantly reduces compilation time. Optional features include automatic diff generation for revision tracking and file watching for hot-recompile mode. Color coding: green (start/end), orange (engine selection), blue (preprocessing), purple (parallel processing), gray (decision points).

Missing Figure 04_directory_structure

Figure 4 – SciTeX Writer Directory Organization. This diagram shows the hierarchical organization of the repository structure. The `00_shared/` directory (green) contains resources used across all document types, including bibliography files and LaTeX styles, ensuring consistency without duplication. The three document directories (blue/purple) follow identical internal structures, facilitating familiarity and code reuse. Each document has its own `contents/` subdirectory with `figures/` and `tables/` organized into `caption_and_media/` (source files) and `compiled/` (generated LaTeX code). The modular structure minimizes merge conflicts during collaborative editing by isolating frequently-modified content files. Compilation scripts (orange) and configuration files (red) reside in dedicated directories for easy discovery and maintenance. Dotted lines indicate that supplementary materials follow the same organizational pattern as the main manuscript.

Missing Figure 04_system_architecture

Figure 5 – SciTeX Writer System Architecture. High-level overview of the SciTeX Writer framework showing the layered architecture from user interface to output generation. The system comprises six main layers: User Layer (CLI and configuration), Core System (scripts and engine selection), Compilation Engines (Tectonic, latexmk, 3-pass), Asset Processing (parallel figure/table/bibliography processing), Content Layer (shared metadata and three document types), and Output Layer (PDFs, diffs, archives, logs). The shared metadata directory (00_shared/) provides a single source of truth for bibliographies, author lists, and other metadata used across all document types. Color coding indicates functional groupings: green (user interface), blue (core system), orange (engines), purple (processing), pink (content), teal (output).

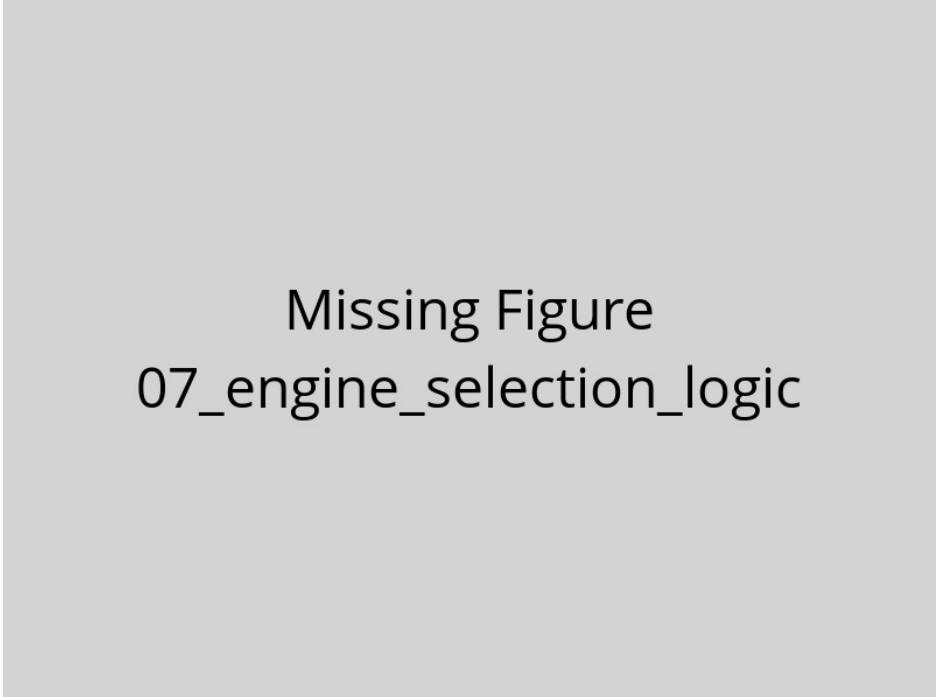

Missing Figure 05_feature_overview

Figure 6 – SciTeX Writer Feature Overview. Mind map visualization of key features organized into five main categories: (1) Compilation System with multiple engines and container support, (2) Performance optimizations including caching and parallel processing, (3) Content Management with multi-file bibliography support and asset processing, (4) Version Control with automatic archiving and diff generation, and (5) Customization options for citations, appearance, and configuration. The system balances automation with flexibility, providing sensible defaults while allowing fine-grained control through environment variables and command-line options. Notable features include sub-3-second compilation in ultra-fast mode, automatic DOI-based bibliography deduplication, and support for diverse figure formats including Mermaid diagrams.

Missing Figure

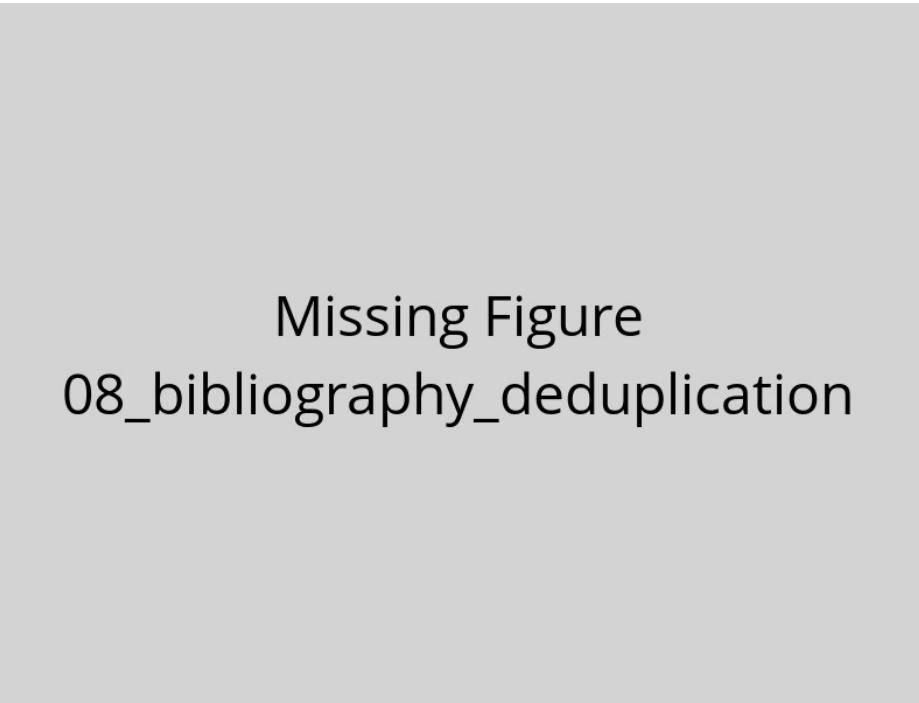

06_directory_structure

Figure 7 – SciTeX Writer Directory Structure. Hierarchical organization of the SciTeX Writer framework showing the relationship between shared resources and document-specific directories. The `00_shared/` directory serves as a single source of truth for metadata, bibliography files, and LaTeX styles, which are automatically included in all three document types (manuscript, supplementary, revision). Each document directory (`01_manuscript/`, `02_supplementary/`, `03_revision/`) follows an identical structure with contents, figures, tables, and archives. The `scripts/` directory contains the compilation system with shell and Python modules for figure processing, table processing, bibliography deduplication, and multi-engine compilation. The `config/` directory provides YAML-based configuration for each document type. Dotted arrows indicate dependency relationships: shared resources are used by all documents, and configuration controls the compilation scripts. Color coding: blue (root), green (shared), orange (manuscript), purple (supplementary), red (revision), cyan (scripts), yellow (configuration).

Missing Figure 07_engine_selection_logic

Figure 8 – Compilation Engine Selection Logic. Decision flow for automatic compilation engine selection in SciTeX Writer. When no engine is explicitly specified by the user, the system auto-detects the best available option using a priority order: latexmk (fastest at ~ 3 s), tectonic (reproducible at $\sim 4\text{--}5$ s), or 3-pass (guaranteed compatibility at $\sim 6\text{--}7$ s). This auto-detection ensures optimal performance while maintaining broad compatibility across different computing environments. Users can override auto-detection by explicitly specifying an engine via the `SCITEX_WRITER_ENGINE` environment variable or command-line arguments. Color coding: green (start/end), blue (latexmk), orange (tectonic), purple (3-pass).

Missing Figure 08_bibliography_deduplication

Figure 9 – Multi-file Bibliography Deduplication Logic. Workflow for merging and deduplicating bibliographic references from multiple .bib files in the 00_shared/bib_files/ directory. The system first attempts DOI-based deduplication for maximum accuracy, as DOIs provide unique identifiers for publications. For entries without DOIs, the system falls back to title and year matching to identify duplicates. This two-tier approach enables researchers to organize references by topic (e.g., methods_refs.bib, field_background.bib, my_papers.bib) without worrying about duplicate entries across files. The merged bibliography is automatically generated during compilation and includes only unique references, with duplicates silently removed based on the matching criteria. Color coding: green (start/end), blue (DOI matching), orange (title matching), red (skip duplicate), cyan (add entry).
